Md Abul Hayat

Problem 2.2

Here, $X = \text{true status } (1 = \text{disease}, 2 = \text{no disease}), Y = \text{diagnosis } (1 = \text{positive}, 2 = \text{negative}) \text{ and } \pi_i = P(Y = 1 | X = i) \quad \forall i \in \{1, 2\}$

- (a) Sensitivity = True Positive Rate = $P(Y = 1|X = 1) = \pi_1$. Specificity = True Negative Rate = $P(Y = 2|X = 2) = 1 - P(Y = 1|X = 2) = 1 - \pi_2$
- (b) Here, $P(X=1) = \gamma$

$$P(X=1|Y=1) = \frac{P(Y=1|X=1)P(X=1)}{P(Y=1|X=1)P(X=1) + P(Y=1|X=2)P(X=2)} = \frac{\gamma \pi_1}{\gamma \pi_1 + \pi_2(1-\gamma)}$$

(c) Here, $\gamma = 0.01$, $\pi_1 = 0.86$ and $\pi_2 = 1$ -Specificity = 1 - 0.88 = 0.12. The pobability of truely having cancer given positive test result is

```
p1 = 0.86; p2 = 1-0.88; gamma = 0.01
((gamma*p1)/((gamma*p1)+p2*(1-gamma)))
```

Problem 2.10

Let, X = race of murderer (1 = black, 2 = white) and Y = race of victim (1 = black, 2 = white)

- (a) The conditional distributions refer to X|Y. Here, P(X=1|Y=1)=0.91 and P(X=2|Y=2)=0.83
- (b) Odds Ratio,

$$\theta = \frac{P(X=1,Y=1)}{P(X=1,Y=2)} \frac{P(X=2,Y=2)}{P(X=2,Y=1)} = \frac{P(X=1|Y=1)}{P(X=1|Y=2)} \frac{P(X=2|Y=2)}{P(X=2|Y=1)} = \frac{0.91}{1-0.83} \frac{0.83}{1-0.91} = \boxed{49.36}$$

Hence, the odds of a black man killed by a black murderer is 49.36 times higher than odds of being killed by a white murderer.

(c) The probability that the victim was white, given that a murderer was white

$$P(Y=2|X=2) = \frac{P(X=2|Y=2)P(Y=2)}{P(X=2|Y=1)P(Y=1) + P(X=2|Y=2)P(Y=2)} = \frac{0.83 \times P(Y=2)}{0.09 \times P(Y=1) + 0.83 \times P(Y=2)} = \frac{0.83 \times P(Y=2)}{0.09 \times P(Y=1) + 0.83 \times P(Y=2)} = \frac{0.83 \times P(Y=2)}{0.09 \times P(Y=1) + 0.83 \times P(Y=2)} = \frac{0.83 \times P(Y=2)}{0.09 \times P(Y=1) + 0.83 \times P(Y=2)} = \frac{0.83 \times P(Y=2)}{0.09 \times P(Y=1) + 0.83 \times P(Y=2)} = \frac{0.83 \times P(Y=2)}{0.09 \times P(Y=1) + 0.83 \times P(Y=2)} = \frac{0.83 \times P(Y=2)}{0.09 \times P(Y=1) + 0.83 \times P(Y=2)} = \frac{0.83 \times P(Y=2)}{0.09 \times P(Y=1) + 0.83 \times P(Y=2)} = \frac{0.83 \times P(Y=2)}{0.09 \times P(Y=1) + 0.83 \times P(Y=2)} = \frac{0.83 \times P(Y=2)}{0.09 \times P(Y=1) + 0.83 \times P(Y=2)} = \frac{0.83 \times P(Y=2)}{0.09 \times P(Y=1) + 0.83 \times P(Y=2)} = \frac{0.83 \times P(Y=2)}{0.09 \times P(Y=1) + 0.83 \times P(Y=2)} = \frac{0.83 \times P(Y=2)}{0.09 \times P(Y=1) + 0.83 \times P(Y=2)} = \frac{0.83 \times P(Y=2)}{0.09 \times P(Y=1) + 0.83 \times P(Y=2)} = \frac{0.83 \times P(Y=2)}{0.09 \times P(Y=1) + 0.83 \times P(Y=2)} = \frac{0.83 \times P(Y=2)}{0.09 \times P(Y=1) + 0.83 \times P(Y=2)} = \frac{0.83 \times P(Y=2)}{0.09 \times P(Y=1) + 0.83 \times P(Y=2)} = \frac{0.83 \times P(Y=2)}{0.09 \times P(Y=1) + 0.83 \times P(Y=2)} = \frac{0.83 \times P(Y=2)}{0.09 \times P(Y=1) + 0.83 \times P(Y=2)} = \frac{0.83 \times P(Y=2)}{0.09 \times P(Y=1) + 0.83 \times P(Y=2)} = \frac{0.83 \times P(Y=2)}{0.09 \times P(Y=1)} = \frac{0.83 \times P(Y=2)}{0.09 \times P(Y=1)} = \frac{0.83 \times P(Y=2)}{0.09 \times P(Y=1)} = \frac{0.83 \times P(Y=2)}{0.09 \times P(Y=2)} = \frac{0.83 \times P(Y=2)}{0.0$$

So, we need either P(Y=1) or P(Y=2) to find the probability above.
